IRIS / ORFEUS Workshop
Understanding and Managing
Information from Seismological Networks

28 Feb – 4 Mar 2005, Palmanova, Italy

Orfeus Data Center: data pipeline

VEBSN – Virtual European Broadband Seismograph Network

Quality Control at ODC: new (RT) stations

- **validation and verification of station information**
 - ⇒ station code (NEIC registered: neic.usgs.gov)
 - ⇒ network code (FDSN registered: www.fdsn.org)
 - ⇒ system information (sensor, digitizer, sampling rate, etc.)
 - ⇒ system response (validation of completeness & consistency)

Quality Control at ODC: new (RT) stations

- **validation and verification of station information**
 - ⇒ station code (NEIC registered: neic.usgs.gov)
 - ⇒ network code (FDSN registered: www.fdsn.org)
 - ⇒ system information (sensor, digitizer, sampling rate, etc.)
 - ⇒ system response (validation of completeness & consistency)

- **monitoring of communication and waveform quality (for RT stations)**
 - ⇒ quarantine system (reliability, stability, gaps, time-order, overlaps, ...)
 - ⇒ waveform data

Quality Control at ODC: tools

- **Antelope** ®
communication, gaps, clipping,
- **software** (evalresp, PDCC, seedtools, verseed, ...)
SEED problems

seedtools:

- **edit SEED volume**
- **verify SEED volumes**
- **merge multiple SEED volumes**
- **extract SEED subvolumes**
- **repair SEED volumes**
- **build full SEED (dataless + mini-SEED)**
- **~ 100 different options**

Quality Control at ODC: tools

- **Antelope** ®
communication, gaps, clipping,
- **software** (evalresp, PDCC, seedtools, verseed, ...)
SEED problems
- **new development: Quality Control Monitor (QCM)**
to monitor the quality of the data and the seismic station and
to verify the seismic information (meta-data, waveform)

Quality Control Monitor (QCM)

Applied on VEBSN

- **overall quality of data versus time (PSD vs. time)**
 - ⇒ monitor changes in behavior of seismic system
 - ⇒ malfunctioning of seismic instrumentation
 - ⇒ changes in response information
 - ⇒ changes in local site conditions
 - ⇒ long term behavior

Quality Control Monitor (QCM)

Applied on VEBSN

- **overall quality of data versus time (PSD vs. time)**
 - ⇒ monitor changes in behavior of seismic system
 - ⇒ malfunctioning of seismic instrumentation
 - ⇒ changes in response information
 - ⇒ changes in local site conditions
 - ⇒ long term behavior
- **statistical representation**
 - ⇒ statistical distribution of the background noise
(PSD vs. freq.)

Quality Control Monitor (QCM)

Applied on VEBSN

- **overall quality of data versus time (PSD vs. time)**
 - ⇒ monitor changes in behavior of seismic system
 - ⇒ malfunctioning of seismic instrumentation
 - ⇒ changes or changes in response information
 - ⇒ changes in local site conditions
 - ⇒ long term behavior
- **statistical representation**
 - ⇒ statistical distribution of the background noise
(PSD vs. freq.)
- **data availability: StreamView**
 - ⇒ gaps, overlaps, etc.

Overall quality of data versus time (PSD vs. time)

Procedure:

- data extraction (30 min. segments)
 - less than 28 minutes is represented as a gap

Overall quality of data versus time (PSD vs. time)

Procedure:

- data extraction (30 min. segments)
 - less than 28 minutes is considered as a gap
- PSD estimation (periodogram averaging, Welch (1967))
 - only positive frequencies (Peterson's noise model)
 - 0.007 Hz - Nyquist frequency
 - PSD smoothing (constant relative bandwidth of 1/10 decade)

Overall quality of data versus time (PSD vs. time)

Procedure:

- data extraction (30 min. segments)
 - less than 28 minutes is represented as a gap
- PSD estimation (periodogram averaging, Welch (1967))
 - only positive frequencies (Peterson's noise model)
 - 0.007 Hz - Nyquist frequency
 - PSD smoothing (constant relative bandwidth of 1/10 decade)
- instrument response deconvolution
 - no digital filters
 - *poles and zeros, normalization factors, total gain*
 - *poles and zeros, recalculated normalization factors, total gain*
 - *total gain only*

PSD estimation (Welsh, 1967):

- **50 % overlapping time sections (~ 800 sec)**
- **tapering (normalized Hanning window)**
- **Fourier transform**
- **Periodogram:** $PSD(f) = \frac{1}{nf} |X(f)|^2$
- **averaging over the number of time sections**

Synthetic test:

- white noise
- $RMS = \text{gain STS-1 sensor} \times \text{gain digitizer}$
- $\Delta t = 0.025 \text{ sec}$
- deconvolve for STS-1 response and total gain

$$I(\omega) = O(\omega)/H(\omega)$$

Synthetic test:

- white noise
- $RMS = \text{gain STS-1 sensor} \times \text{gain digitizer}$
- $\Delta t = 0.025 \text{ sec}$
- deconvolve for STS-1 response and total gain
$$I(w) = O(w)/H(w)$$

Expected result:

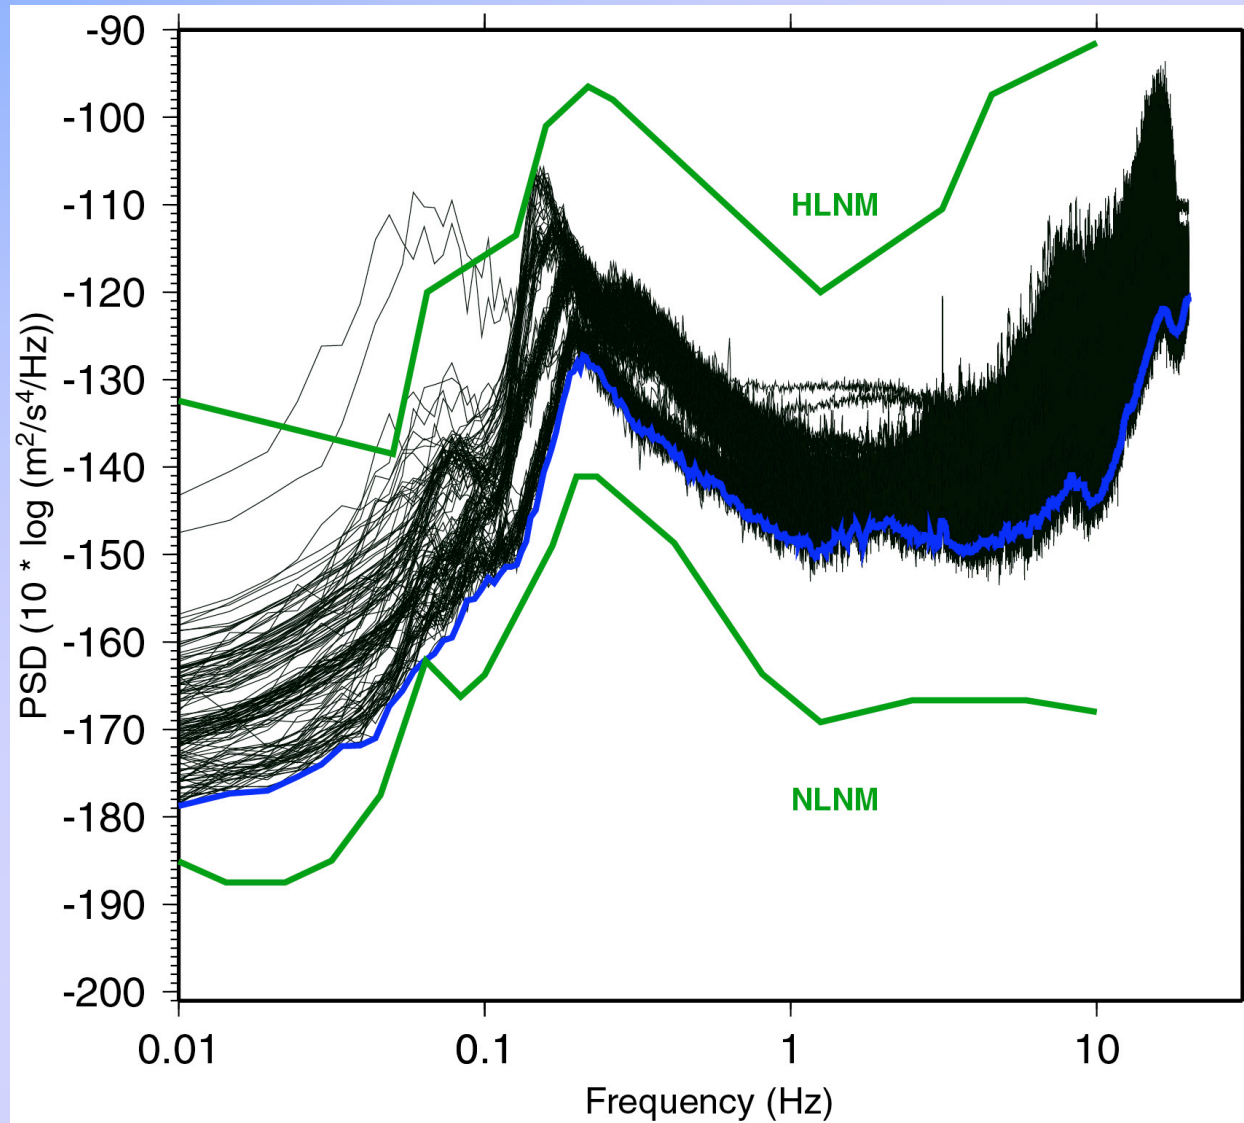

- $RMS = 1$ [360 sec. - 10 Hz]
- $PSD = 10 \cdot \log (2 \times \sigma^2 \times \Delta t)$ (one-sided PSD)
 $= -13 \text{ dB}$
- -10 dB @ 360 sec and @ 10 Hz

Synthetic test: result

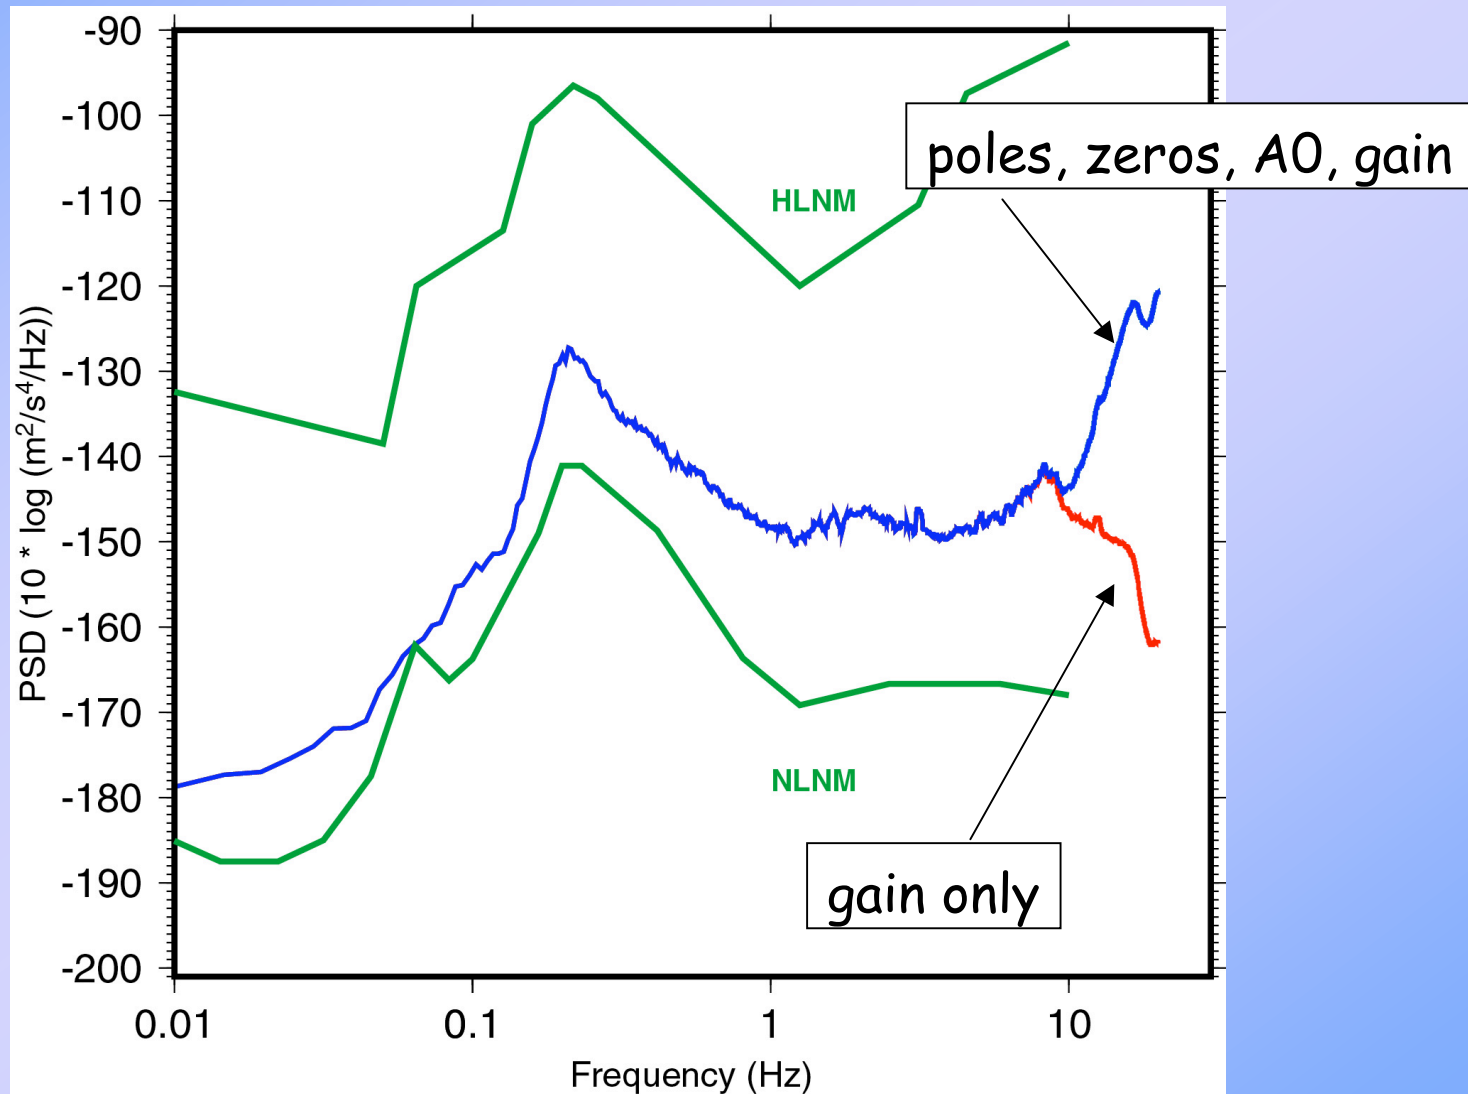

$$\begin{aligned} \text{PSD} &= 10 \cdot \log (2 \times \sigma^2 \times \Delta t) \quad (\text{one-sided PSD}) \\ &= -13 \text{ dB} \end{aligned}$$

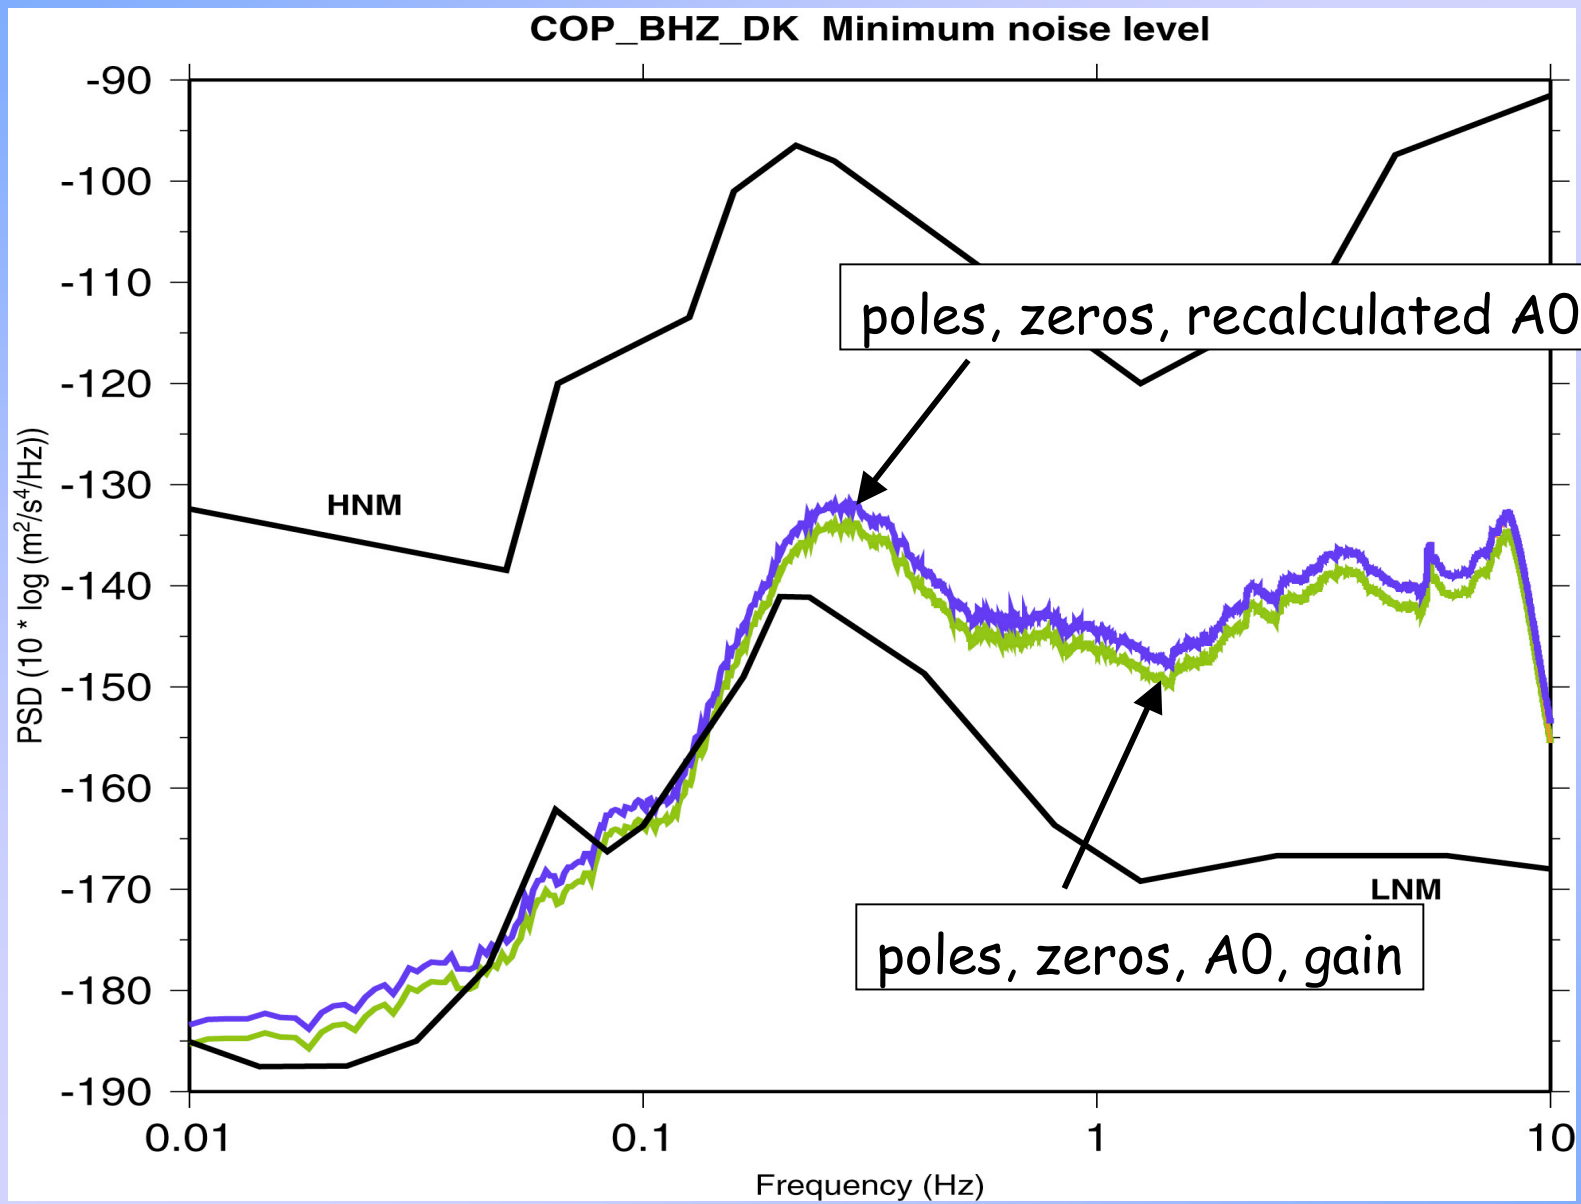

Minimum of smoothed PSD's

Instrument response deconvolution

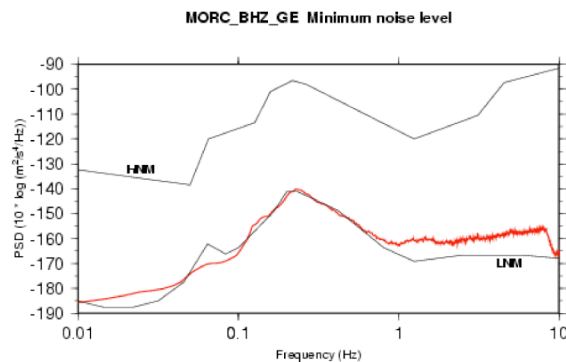

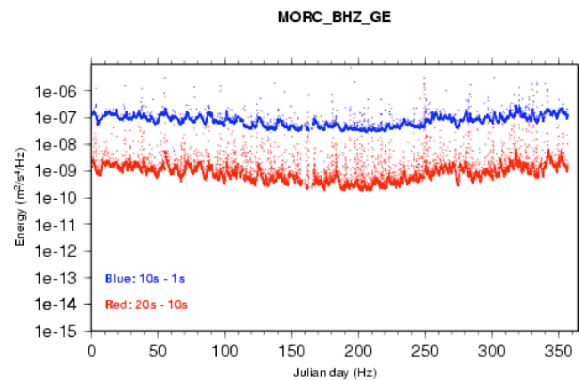

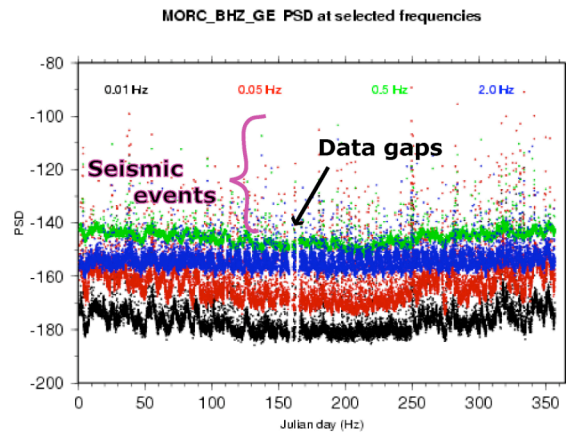

Instrument response deconvolution

PSD vs. time – presentation (in cooperation with Josep Vila)

PSD at selected frequencies vs. time
(0.01, 0.05, 0.5, 2.0 Hz)

Noise energy in two frequency
bands vs. time

(0.05 – 0.1 Hz and 0.1 – 1.0 Hz)

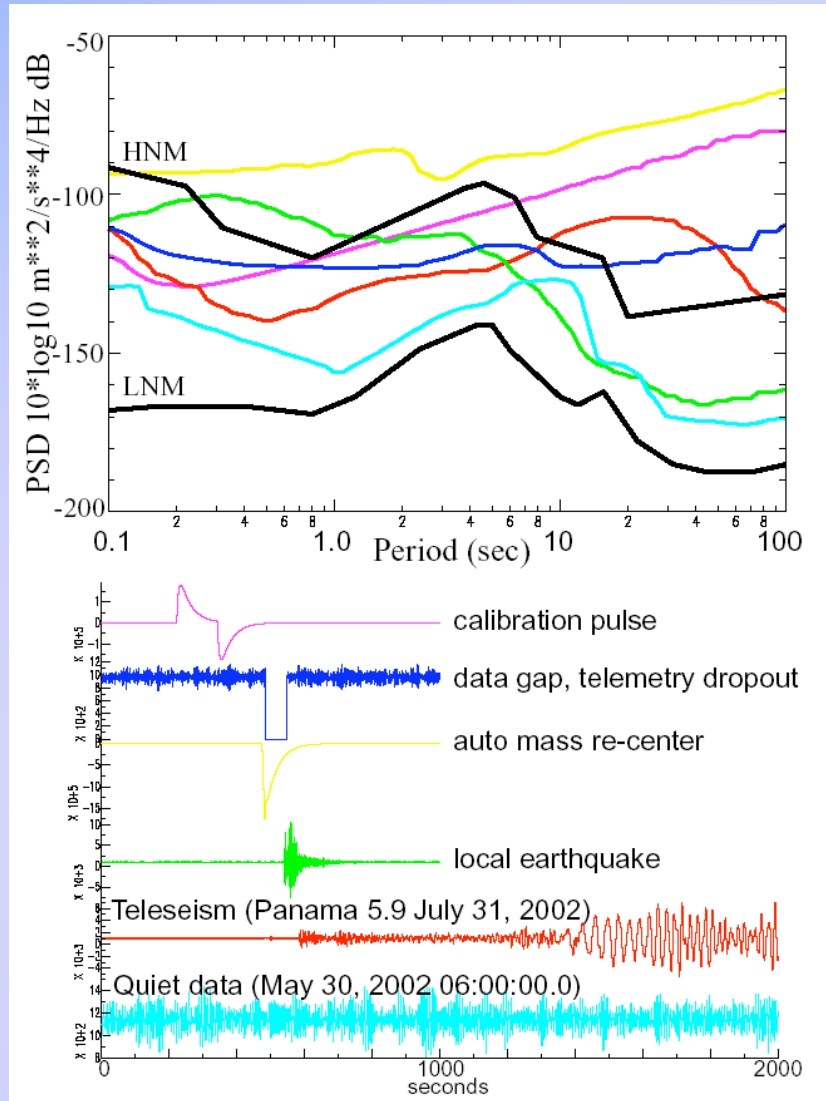

Minimum noise level vs. frequency

(@ 0.2 Hz above -150 dB)

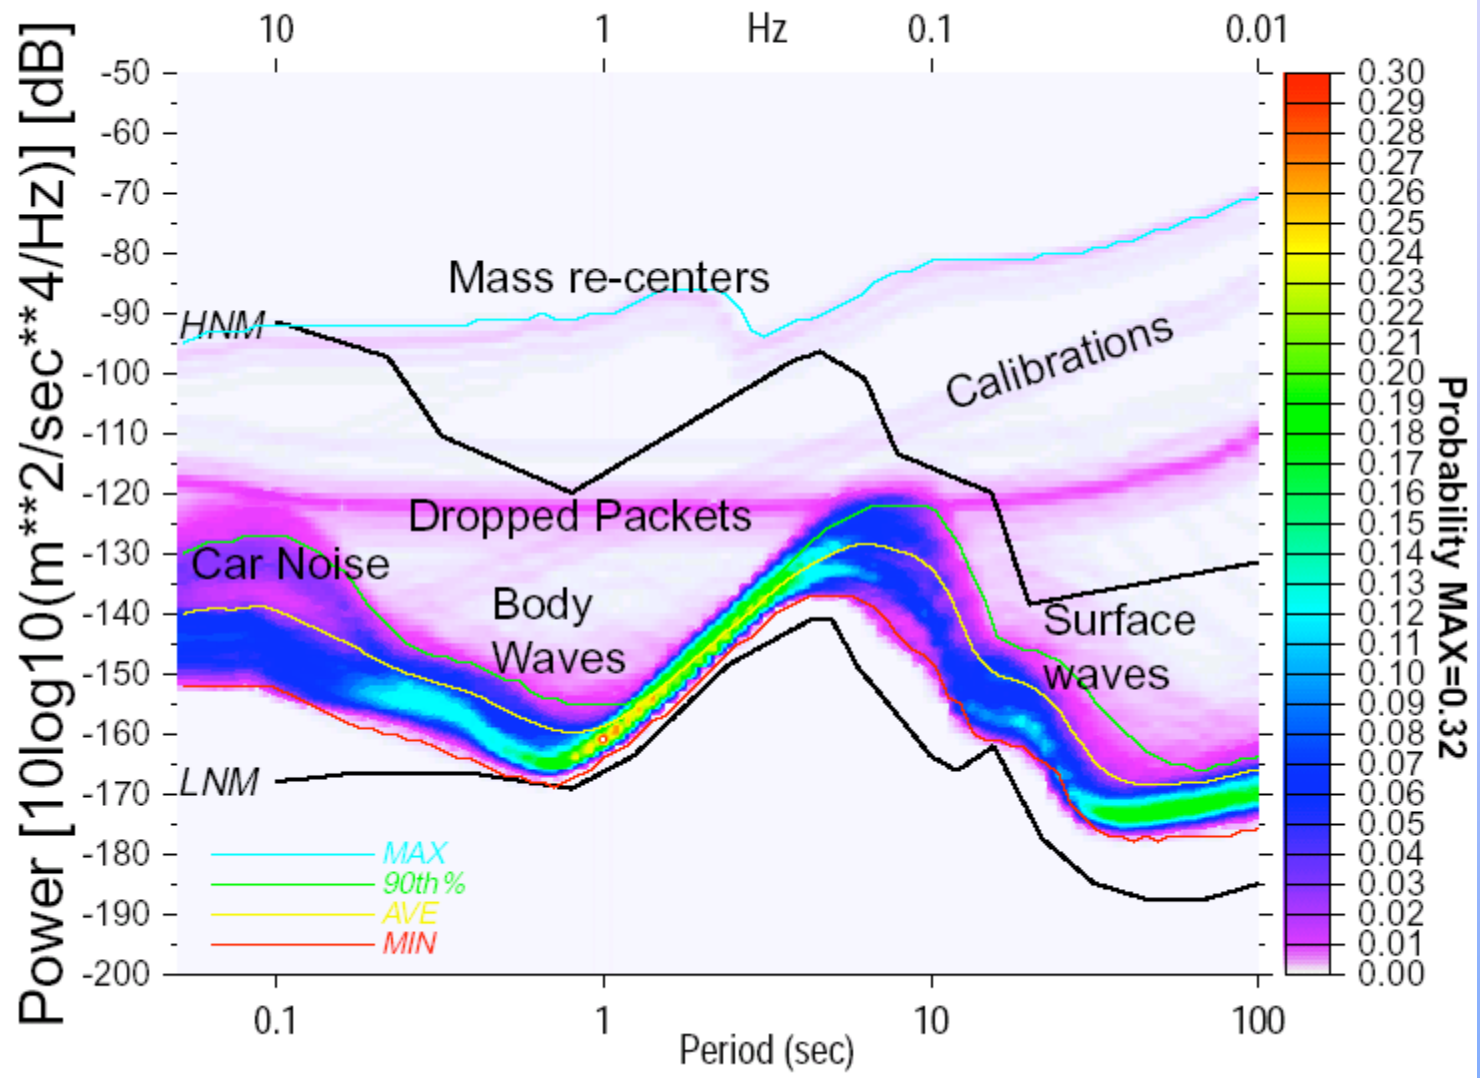

- poles and zeros, normalization factors, total gain
- poles and zeros, recalculated normalization factors, total gain
- total gain only

Statistical distribution of background noise

Procedure (D. McNamara, R. Buland, R. Boaz (IRIS)):

HLID BHZ PDF: # 3226 PSDs

Taken from IRIS DMC

GMT 2004 Aug 27 05:15:48 NLHGN01BHZ PSD PDF

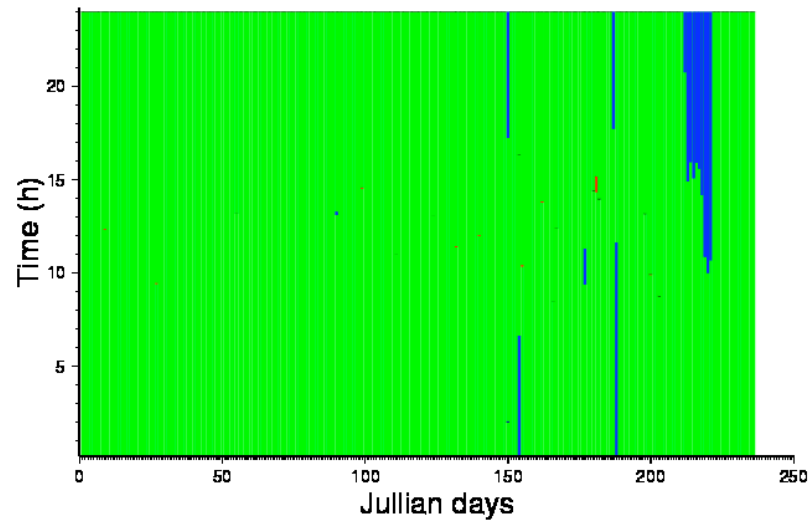

PDF analysis code by Daniel E. McNamara (USGS-NEIC), Ray Buland (USGS-NEIC) & Richard Boaz (private contractor).

availability of data: StreamView

(in development: Lucas Calje)

⇒ gaps, overlaps, patterns

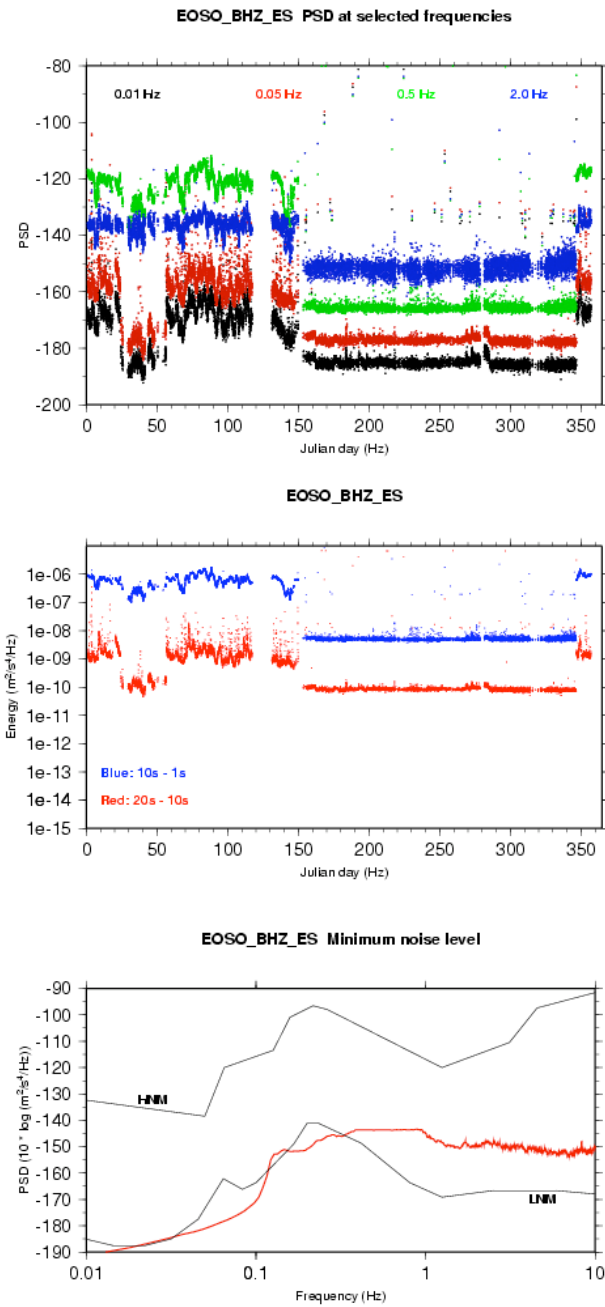

Overview of HGN BHZ_01

Possible future extensions

- ❑ near real-time processing
- ❑ small time-scale waveform data quality monitoring
(e.g. spikes, clipping, discontinuities)
- ❑ detailed quality control monitor (e.g. clock flags, data quality flags)
- ❑ improved phase picking, identification
- ❑ data compression
- ❑ timing
- ❑ sensitivity (magnitude)
- ❑ ...
- ❑ automated feedback procedures to network operators

Example 1

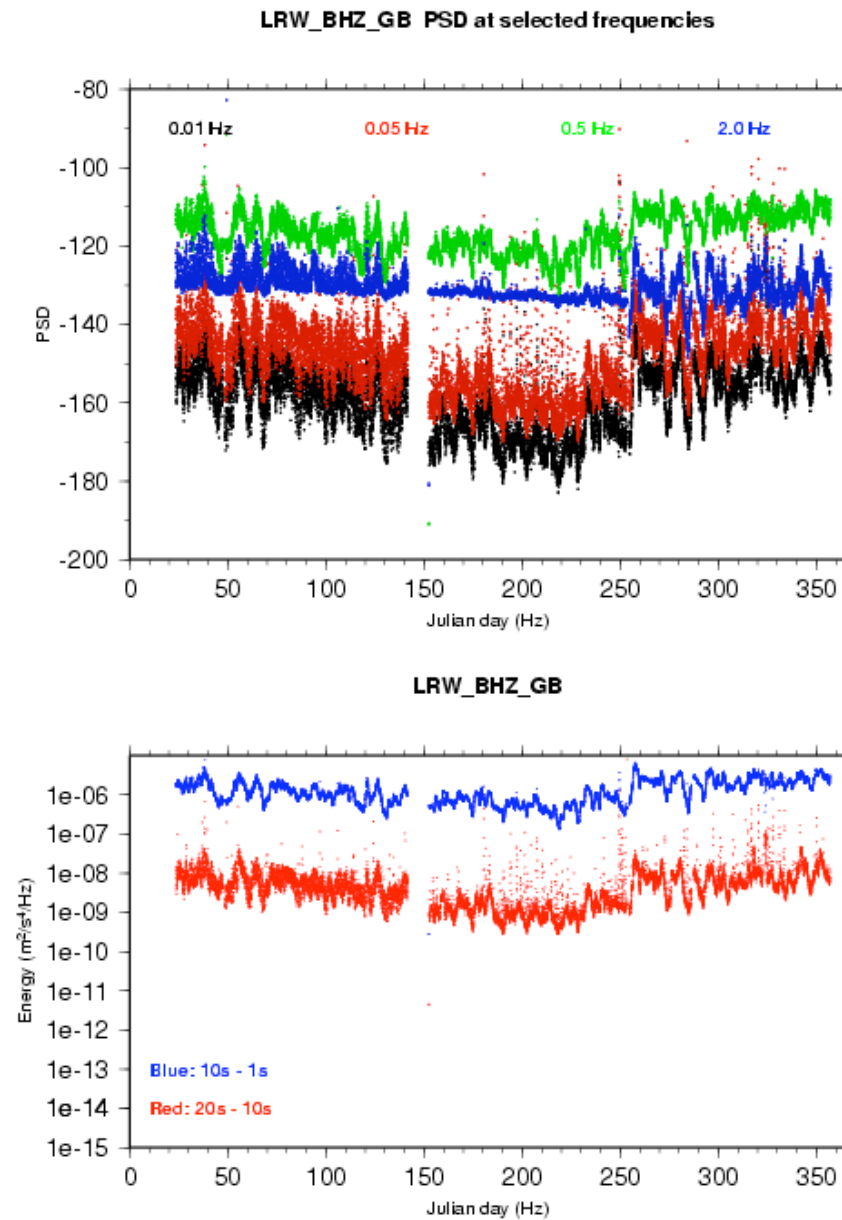

Example 1

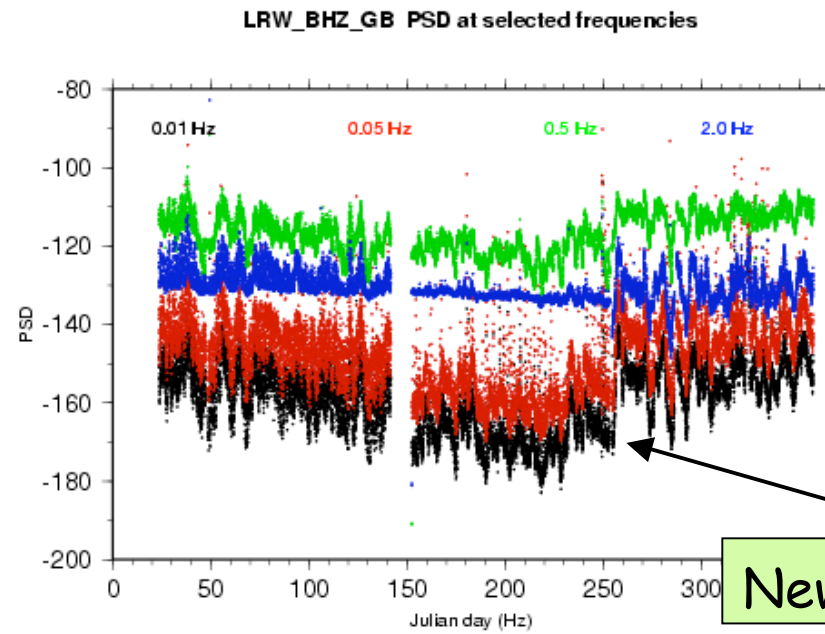

disconnected sensor?
seems not likely

Example 2

Example 2

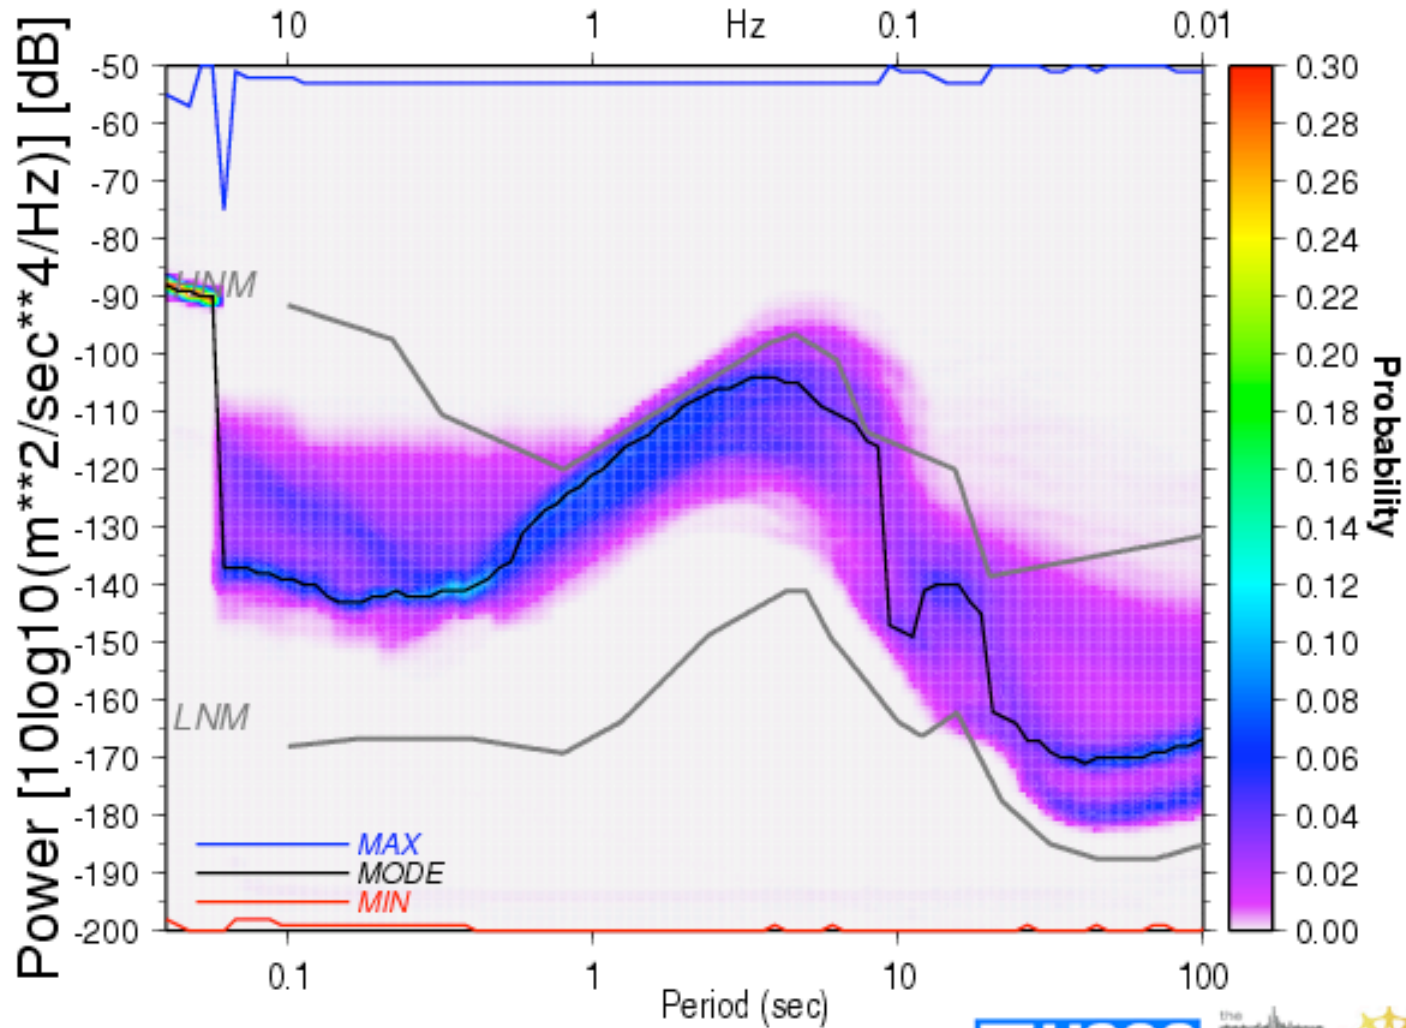

New sensor + digitizer

GB LRW -- BHZ

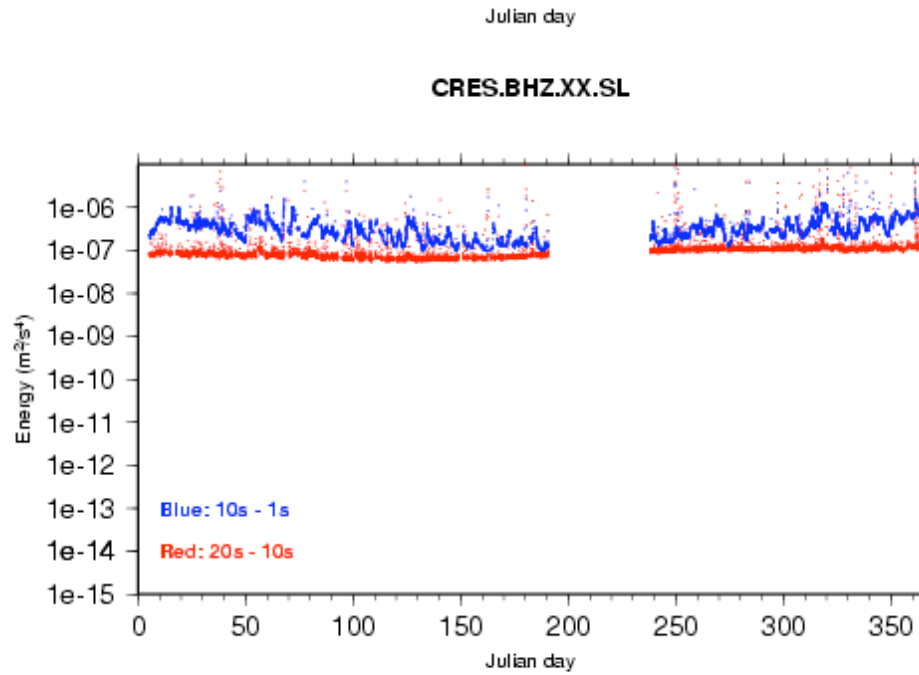

15223 PSDs : 2004:023 - 2004:365

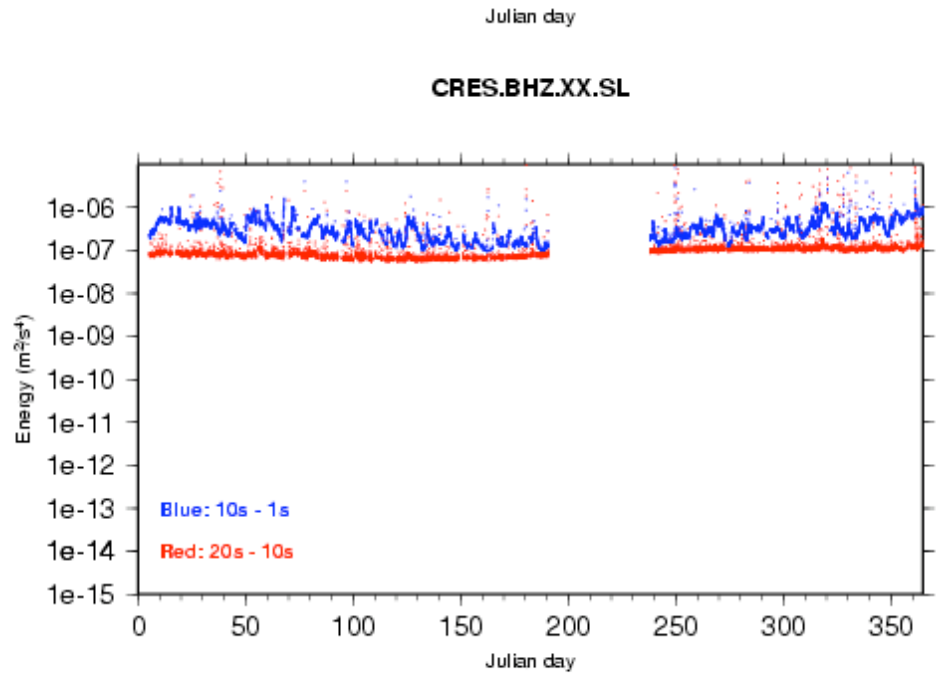

GMT 2005 Feb 18 16:34:04 GB LRW -- BHZ PSD PDF

Example 3

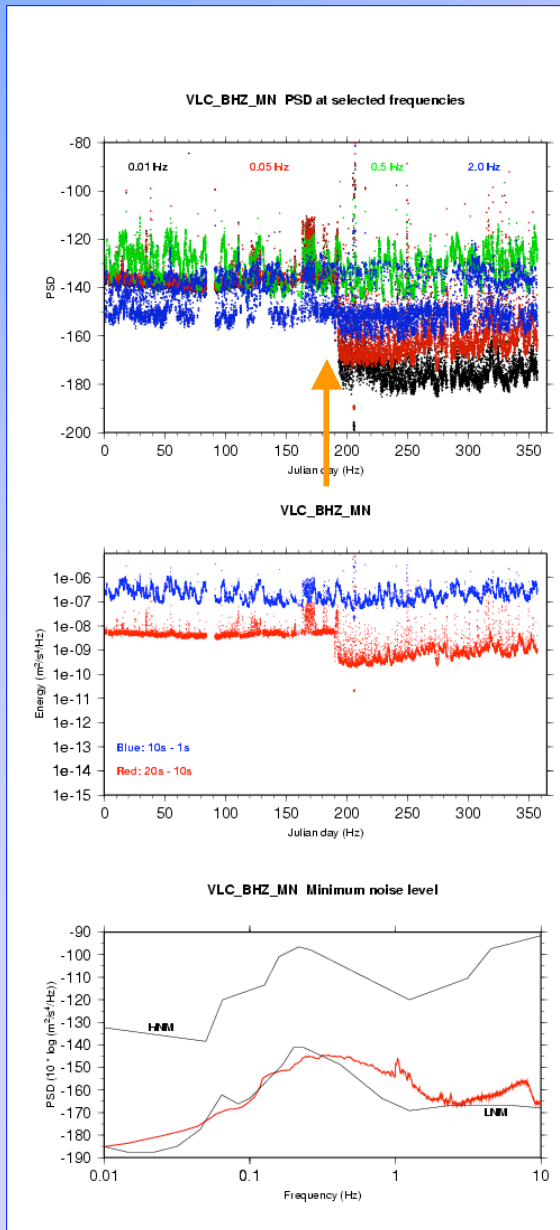

Example 3

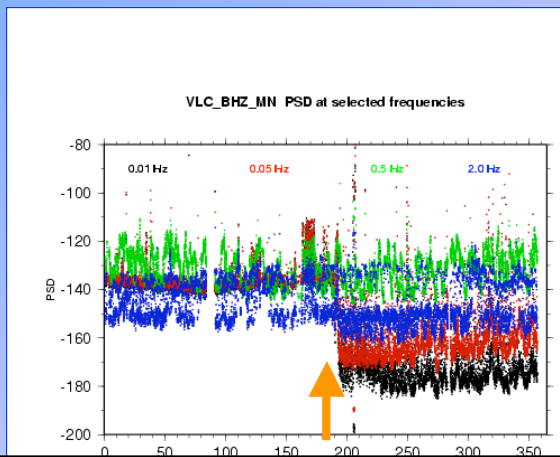

error in meta-data
(sensor gain)

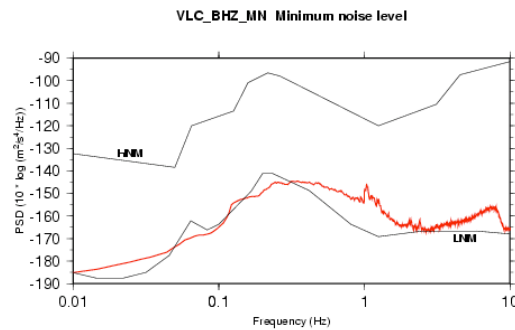

Example 4

Example 4

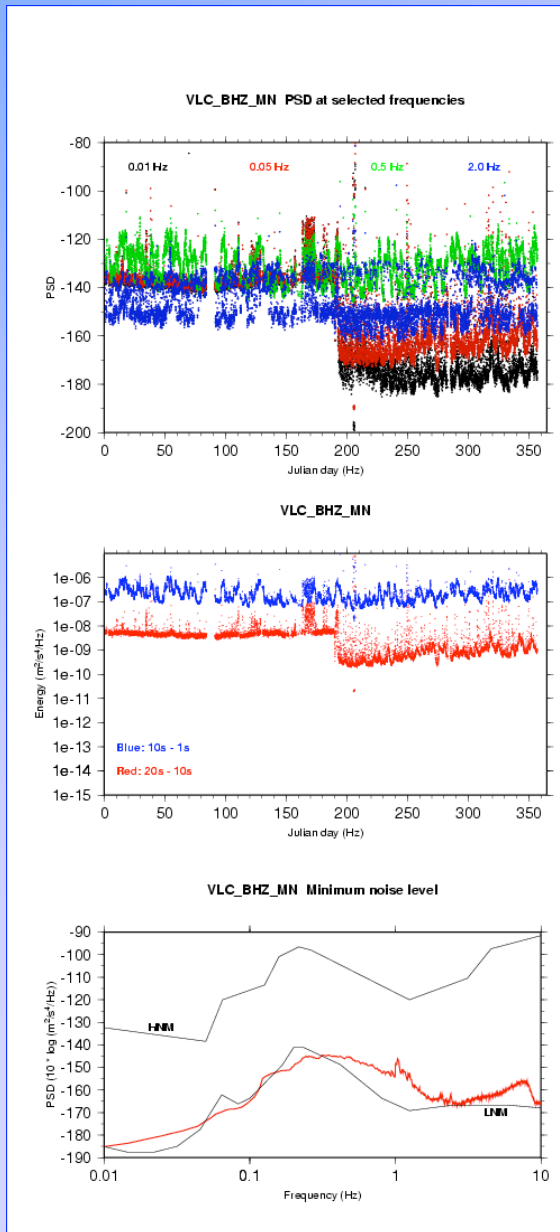

New temperature isolation sensor

Example 4

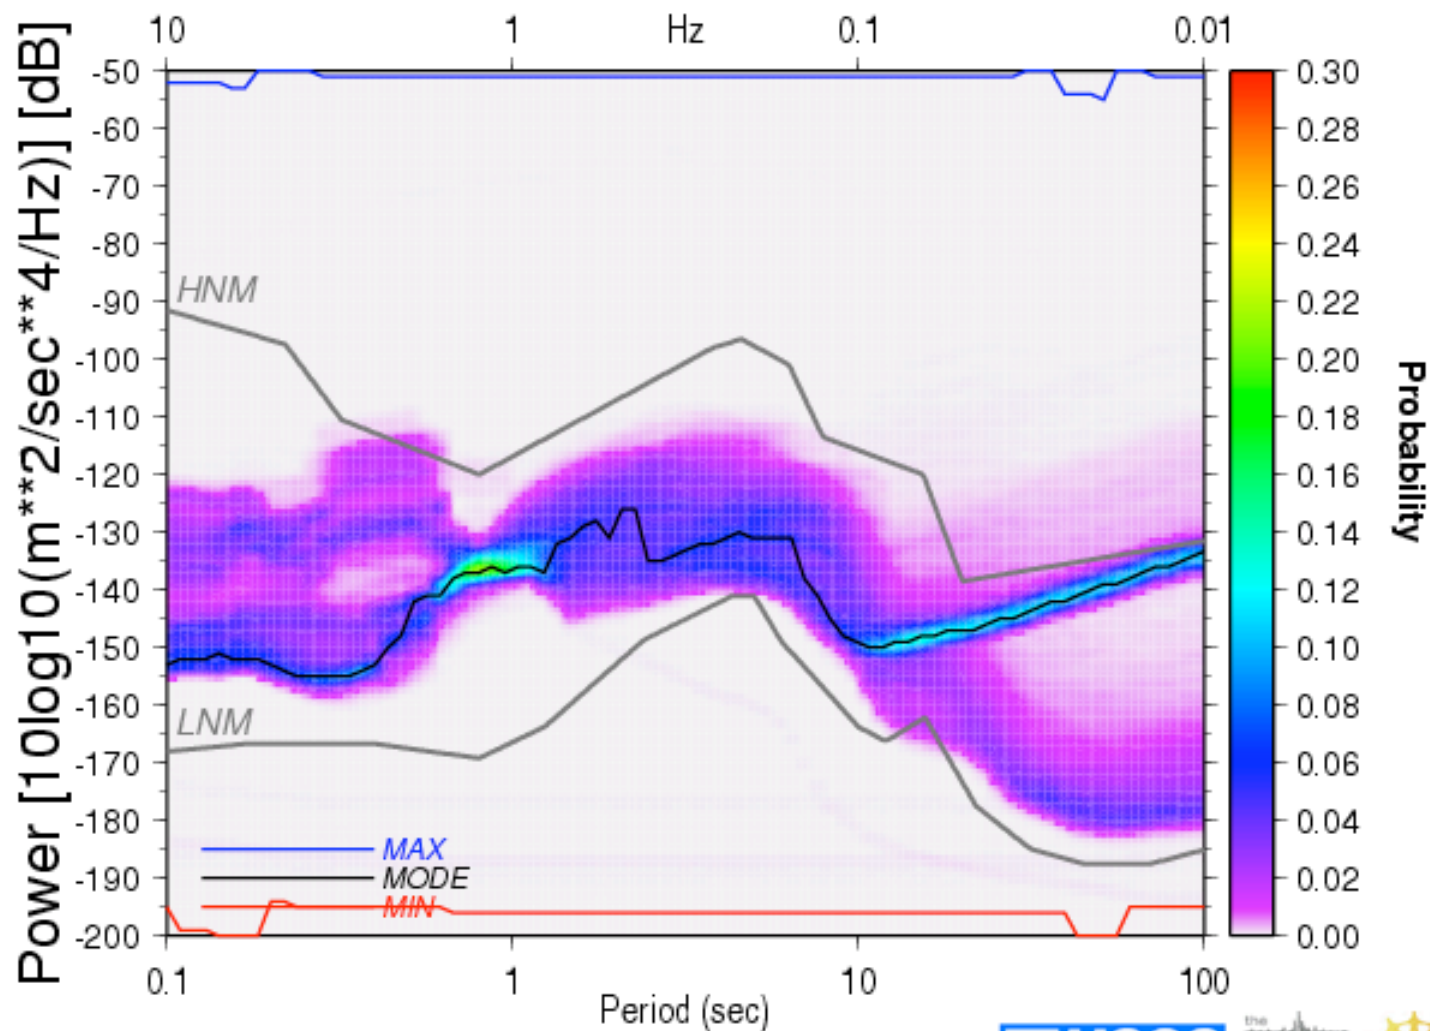

Example 4

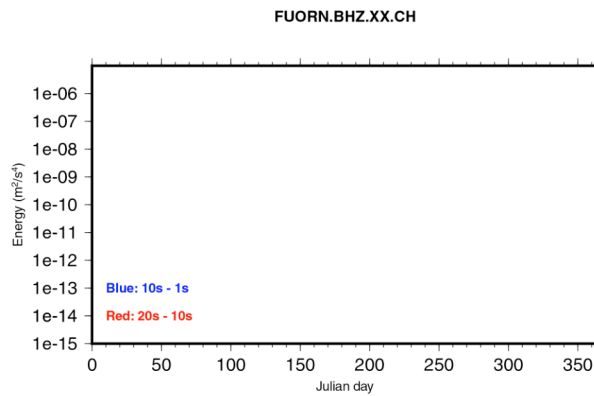

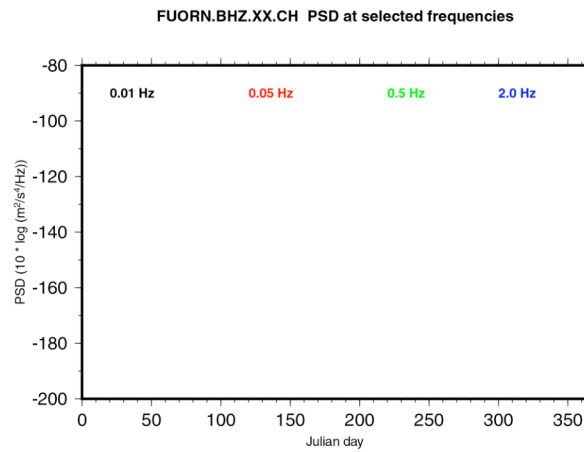

MN VLC -- BHZ

15441 PSDs : 2004:002 - 2004:365

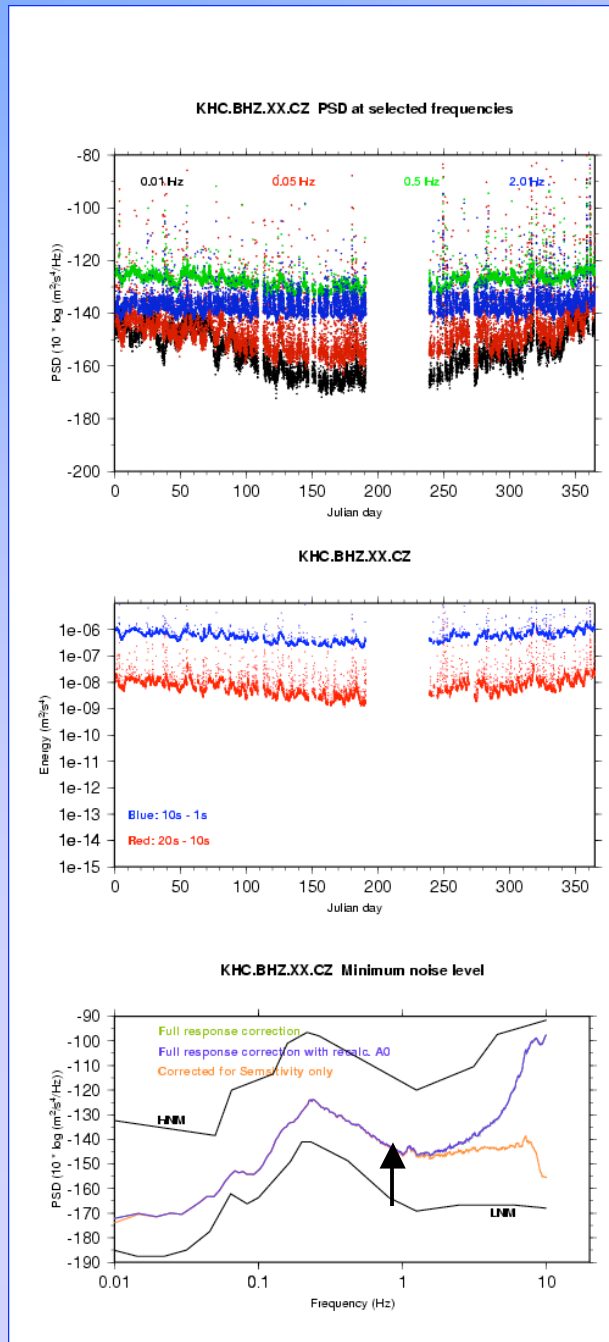

Example 5

error in meta-data:
(normalization factor)

Example 6

suspicious gain in meta-data

QCM will become available: orfeus.knmi.nl

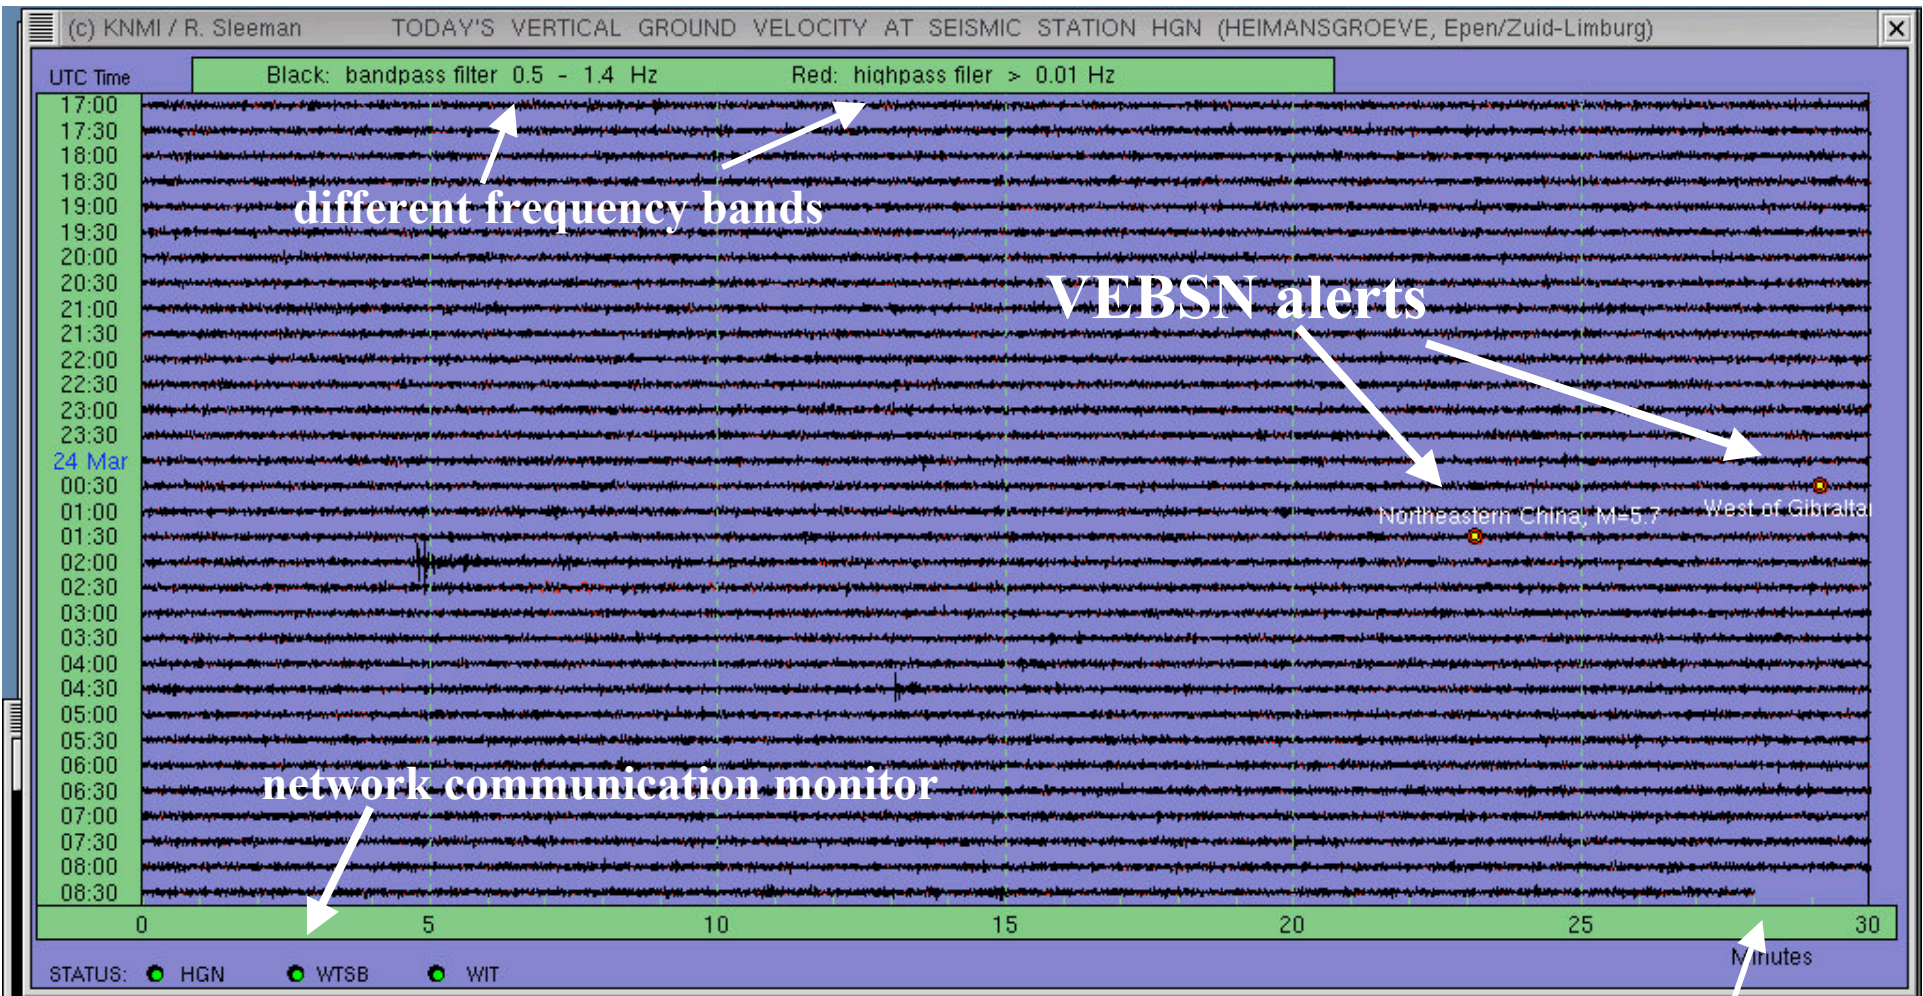

NET-RECORDER,

an all-in-one, real-time seismic monitor for:

- waveform data from any SeedLink server
- status of your network
- VEBSN alerts
- VEBSN seismicity map

In use in several seismological observatories and exhibitions to serve public earthquake monitoring needs

Software requires libslink and lynx (or any other text-based browser) and runs on Linux

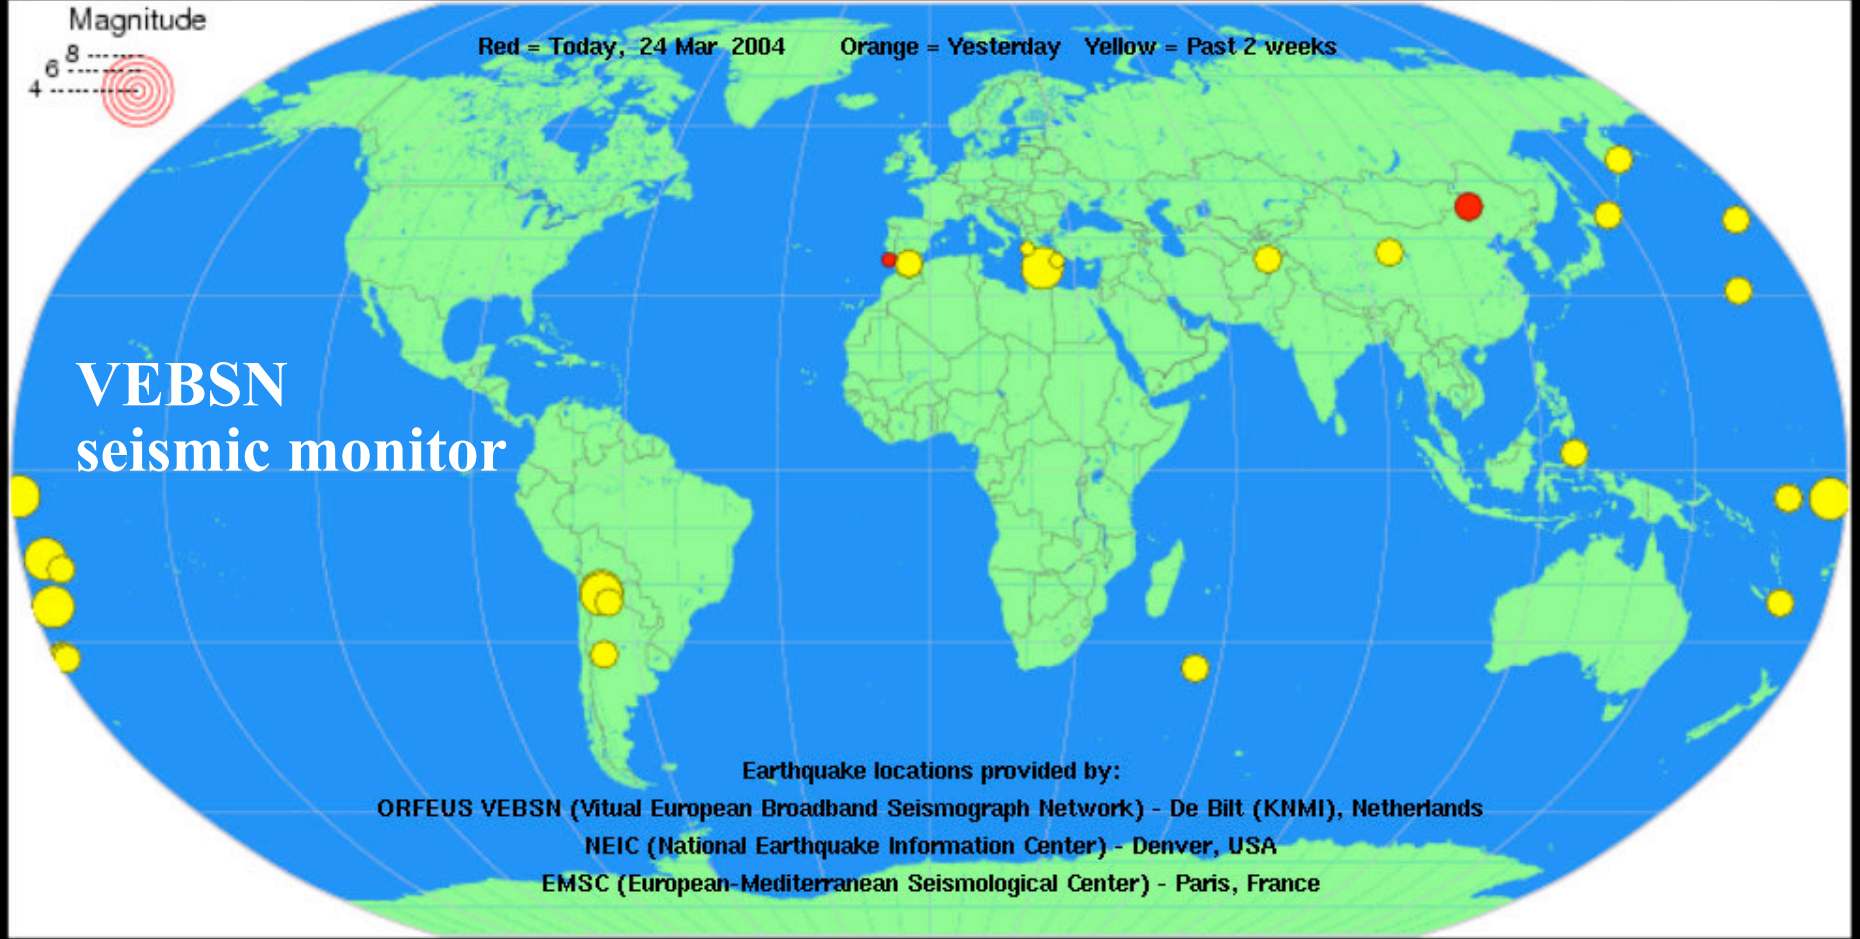

Magnitude

Red = Today, 24 Mar 2004 Orange = Yesterday Yellow = Past 2 weeks

VEBSN seismic monitor

Earthquake locations provided by:
ORFEUS VEBSN (Virtual European Broadband Seismograph Network) - De Bilt (KNMI), Netherlands
NEIC (National Earthquake Information Center) - Denver, USA
EMSC (European-Mediterranean Seismological Center) - Paris, France

Sensor: STS-2 Datalogger: Quanterra 4120 Ground velocity: 1 count = 1.6e-09 m/s Bandpass filter: 0.5 - 1.4 Hz

UTC time: 08:59:00 Date: 24 Mar 2004 Monitoring since: 23 Mar 13:54 Mean latency: ~ 16.6 seconds
