

Introduction to the key features of SEISCOMP3

Dr. Bernd Weber, Dirk Rössler and Jan Becker

gempa GmbH, Potsdam, Germany

August 10, 2015

1 GEMPA

2 SeisComP

- Overview
- BMKG, Jakarta/Indonesia
- Architecture
- Modules
- GUIs

- Commercial spin-off of GFZ Potsdam
- 9 employees (2 seismologists, 4 software engineers, 2 system administrators, 1 web developer)
- Offering solutions for tsunami early warning, local earthquake and geothermal monitoring
- Customers are tsunami warning centers, earthquake services and energy industry

- Software package handling

- ▶ acquisition
- ▶ archiving
- ▶ processing
- ▶ analysis
- ▶ quality control

of seismological data

- Graphical user interfaces for

- ▶ visualization of waveforms and station status
- ▶ event visualization
- ▶ state-of-health monitoring
- ▶ manual analysis

- Emphasis on simplicity and speed

- Developed in the context of tsunami warning

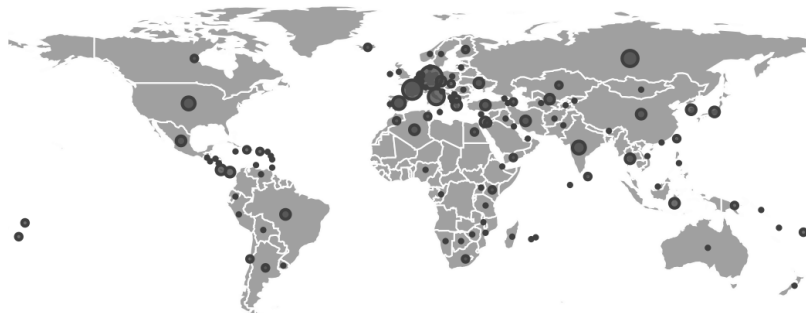

- Originally designed as acquisition and archiving software for GEOFON¹
- **2001** SeedLink as core acquisition protocol and software becomes a de-facto standard in Europe
- **2003** Development of simple automatic analysis tools (after Algerian earthquake)
- **2005**
 - ▶ global associator/locator
 - ▶ interactive analysis using Seismic Handler (SEISCOMP2)
 - ▶ ArcLink server as distributed waveform and meta-data server

¹<http://geofon.gfz-potsdam.de>

- **2006** Development of the 3rd generation of SEISCOMP within GITEWS project
- **2007** Installation at BMKG, Jakarta/Indonesia in May 2007
- **2008** Major release SEISCOMP3 *Barcelona* (first public release)
- **2009** Major release SEISCOMP3 *Erice*
- **2010** Major release SEISCOMP3 *Potsdam*
- **2011** Major release SEISCOMP3 *Zurich*
- **2012** Major release SEISCOMP3 *Seattle*
- **2014** Major release SEISCOMP3 *Jakarta*
Completely open source!

World-wide SeisCOMP installations (last updated March, 2014)

30 tsunami warning centers

50 earthquake monitoring centers

60 universities

50 research centers

10 commercial companies

25 CTBTO NDC using it in daily operation

- Distributed processing
- SeedLink for data acquisition
- SeisComP3XML, a branch of QuakeML² for database schema and communication protocol
- Automatic 2 level P- and S-picker (STA/LTA and AIC)
- Automatic location modules supporting different velocity models and locators
- Magnitudes: MLv, ML, Md, mb, mB, Mw(mB), Mwp, Mw(Mwp), Mjma, Ms(BB)
- Graphical user interfaces
 - ▶ Real-time traces
 - ▶ Network/station status
 - ▶ Event visualization
 - ▶ Event and waveform analysis
 - ▶ State-of-health monitoring
 - ▶ Data quality monitoring

² <http://www.quakeml.org>

- Use of de-facto standards for waveform and parameter exchange (QuakeML, SeedLink, ArcLink, FDSN web services)
- Interprocess communication between modules builds on TCP/IP
- Database support for MYSQL, SQLite3, PostgreSQL
- Scripting interface for Python

Operator's desk with a 4 monitor system connected to the processing server (new warning room)

Retrieves waveform data from remote stations, archives it and delivers it to clients on request

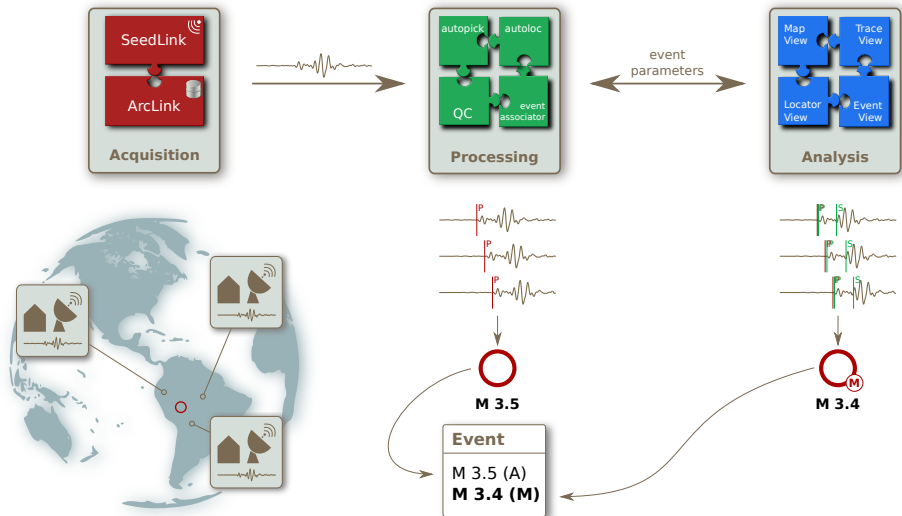

Modules: **SeedLink**, **slarchive** and **ArCLink**

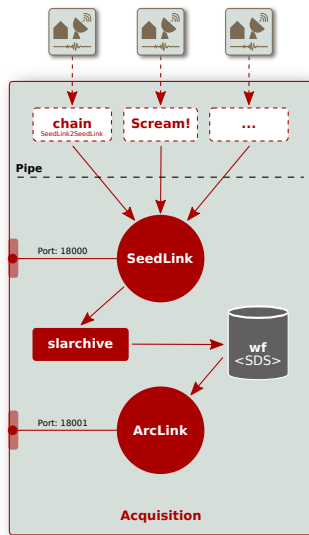

Processes waveform data automatically and emits derived parameters such as picks, amplitudes, magnitudes, hypocenters and events

Modules: **scmaster**, **scautoloc**, **scautopick**, **scamp**, **scmag** and **scevent**

Provides graphical user interfaces to analyse and verify results and waveforms interactively either in realtime or as post event analysis

Modules: **scrttv**, **scmv**, **scolv** and **scsv**

SeedLink collects waveform data from stations through plugins. Many plugins for various digitizers are available. **SeedLink** is a TCP server and delivers TCP data streams to remote clients on port 18000 (configurable).

slarchive stores the waveforms in an archive (SDS structure).

ArcLink provides the archived data as a TCP server to local/remote clients on port 18001 (configurable).

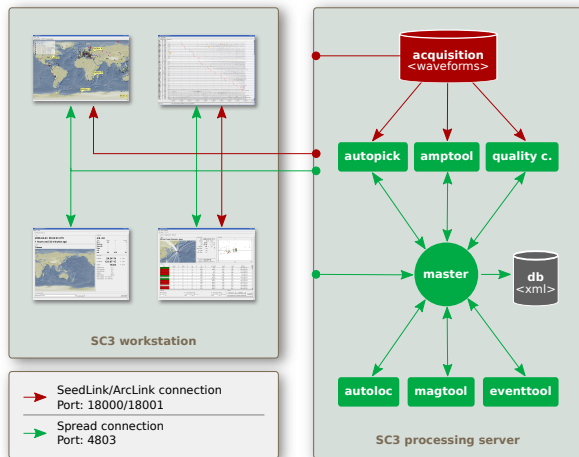

Waveform server provides real time data with SeedLink and archived data with ArcLink

Master is messaging server^a which handles meta data exchange between SC3 modules and stores objects in a database. Connections are excepted from TCP clients on port 4803.

EventTool associates origins (locations) to events and chooses the best location and magnitude among all candidates

^abased on Spread toolkit <http://www.spread.org>

Automatic and interactive system each running on a dedicated computer. Both systems are connected to the same messaging and waveform server.

Name	Description
seedlink	Real time data acquisition
slinktool	SeedLink query interface
slarchive	Storing waveform data in SDS structure
arclink	Retrieval of archived waveform data
arclinktool	ArcLink query interface

Name	Description
scmaster	TCP/IP messaging server
scautopick	Automatic P detector/picker
scautoloc	Automatic locator
screloc	Automatic relocator
scamp	Amplitude calculation
scmag	Magnitude calculation
scevent	Event associator
scqc	Quality parameters of waveforms
scevtlog	Logging of event states
scdb	Database storage of parametric data
scvoice	Acoustic alerts
scalert	Custom alarms

Name	Description
scrttv	Real time trace view
scmv	Map view showing the overall situation
scolv	Revision of processing results and manual picker
scesv	Event summary view
scqcv	Waveform quality view
scheli	Helicorder plots

Name	Description
scconfig	GUI for configuration of SeisComp3
wsfdsn	FDSN webservice implementation
import_inv	Wrapper for inventory converter
inv2dlsv	Inventory to dataless Seed converter
invextr	Extracts or removes networks, stations or channels from an inventory XML file
scinv	Inventory XML merger
stationconf	Station metadata configurator (the old way)
scsohlog	State-of-health logging
scchkcfg	Checks seiscomp configuration for case-sensitivity issues
sdispatch	Sends simple SeisComp3 objects

Name	Description
scart	Export/import waveforms from/into archive
scbulletin	Create event bulletins
scmm	Message and performance monitor
scevtls	List available events
scevtstreams	Extract stream information from events
scimex	Import/export for earthquake parameters
scimport	Message relaying
scm	state-of-health monitor
scxmldump	Dumping event parameters to XML
sczip	SEISCOMP3 file (de)compressor

Name	Description
css2inv	Converts station information from the IDC schema to SeisComP3 XML
inv2css	Converts station information from SeisComP3 XML to the IDC schema
css2proc	Converts IDC results to SeisComP3 XML
proc2css	Converts SeisComP3 results to IDC schema

Name	Description
CAPS	Multi format acquisition server
GDS with GIS	Dissemination server with image generator
QuakeLink	Real-time event information streaming
scanloc	Cluster search based locator using P- and S-phases
ccloc	Crosscorrelation locator (alpha version)
sceval	Origin evaluator based on station distribution comparison
VORTEX	Volcano monitoring supporting RSAM and SSAM
automt/mtv	Automatic and interactive moment tensor calculation
WEBGUIs	Browser based GUIs replacing scrttv, scmtv, scesv, scolv
SMP	Station metadata portal
SMGUI	Strong motion GUI
WebConfig	Browser based version of sconfig

Name	Description
------	-------------

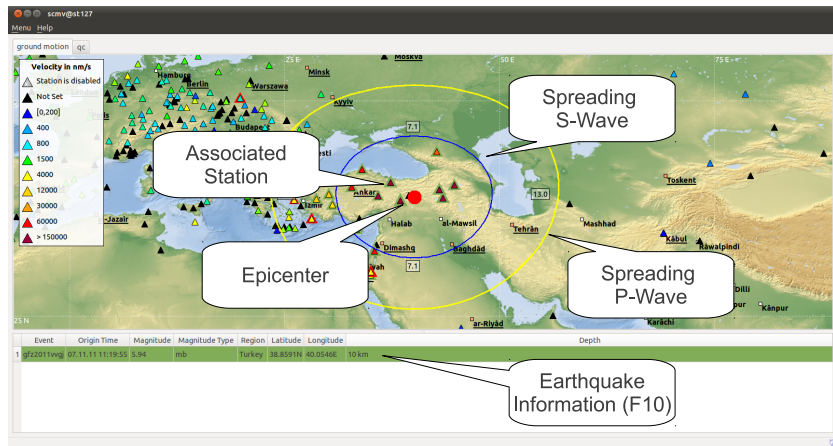

scrttv	Real time trace view
---------------	----------------------

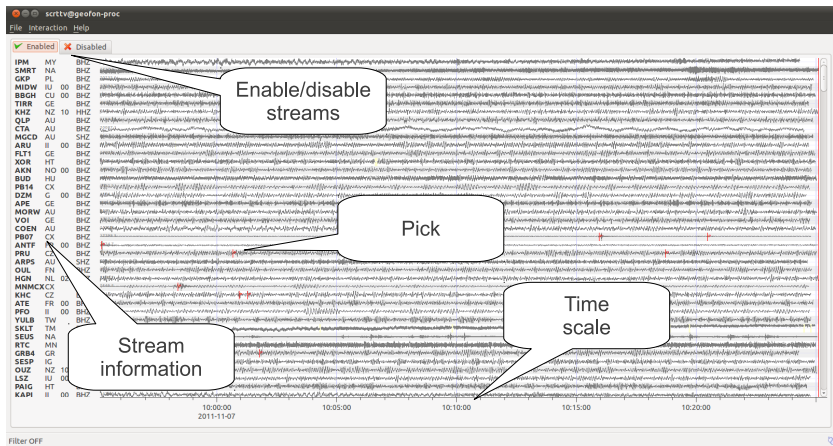

scmv	Map view showing the overall situation
-------------	--

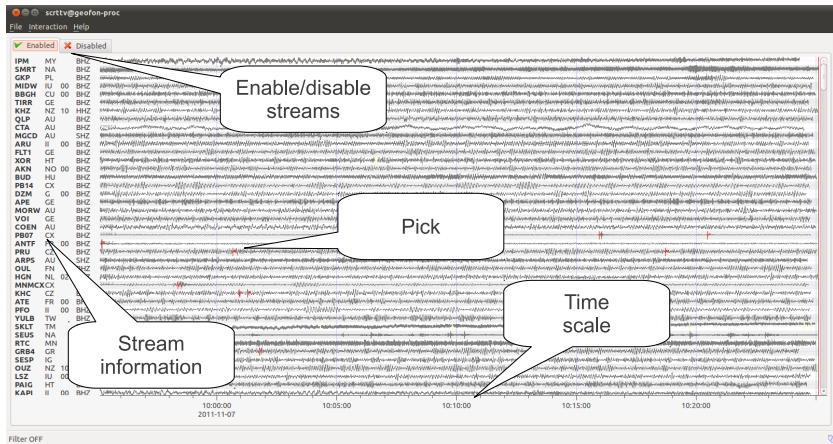

scolv	Revision of processing results and manual picker
--------------	--

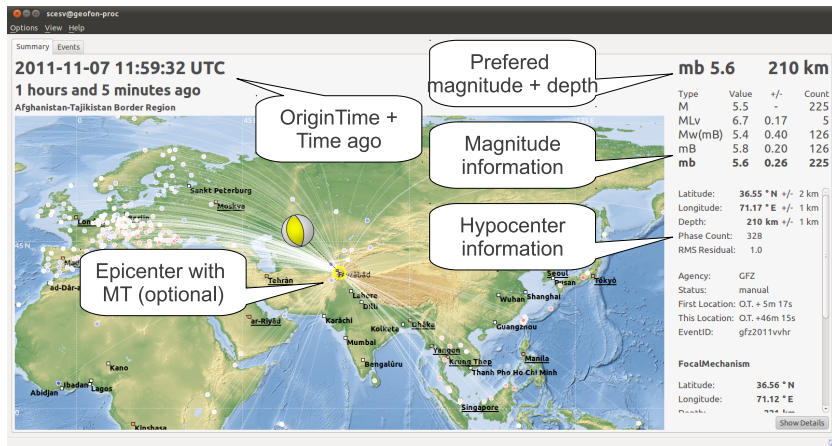

scsv	Event summary view
-------------	--------------------

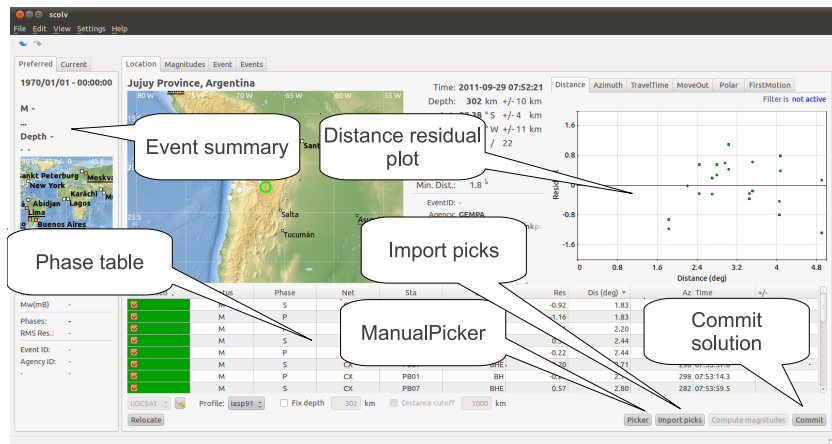

The screenshot shows the OriginLocatorView interface for a seismic event in Jujuy Province, Argentina. The event occurred on 1970/01/01 at 00:00:00. The event summary shows a depth of 302 km +/- 10 km. A distance residual plot shows residuals versus distance in degrees. The interface includes a phase table, a manual picker, and a commit solution button.

Event summary

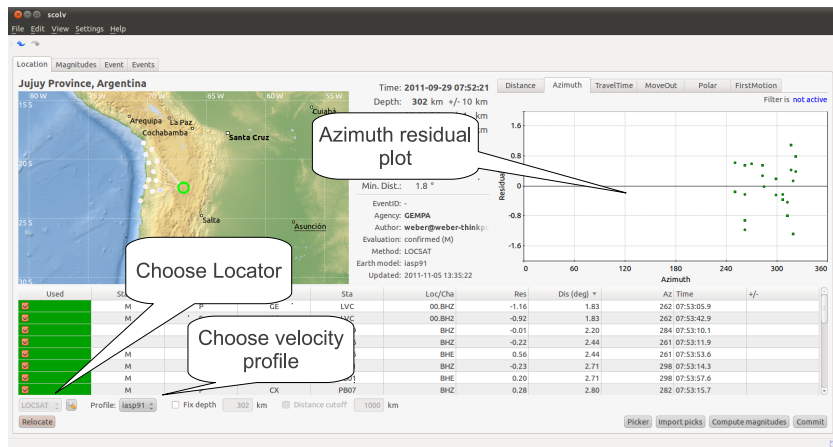

Distance residual plot

Phase table

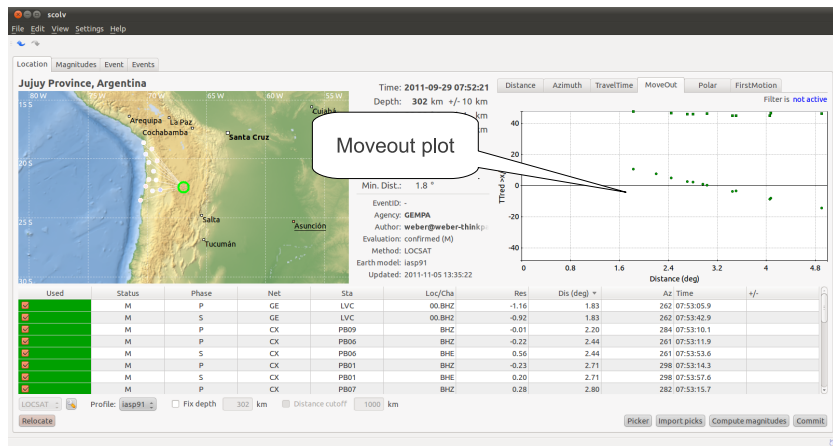

Res	Dis (deg)	Az Time
-0.92	1.83	
-1.16	1.83	
0.00	2.20	
-0.22	2.44	
-0.20	2.71	
0.00	2.71	
0.00	2.71	298 07:53:14.3
0.57	2.80	282 07:53:59.5
